

Guillermo Corpas Pino

Physicist | Software Engineer

Cantabria, Spain | +34 642 403 326 | guicorpasp@gmail.com | linkedin.com/in/gcorpas

Profile

Physicist and software developer with a strong foundation in low-level systems programming and reliable AI. My background in physics drives an analytical approach to building software, focusing on robust architecture and direct hardware interaction using C. Additionally, I leverage Python and PyTorch to design neural networks, bridging the gap between scientific analysis and practical engineering to build reliable, high-quality systems.

Professional Experience

Software Engineer

Sep. 2025 – Present

BERTEN

- / Designed and implemented software components in C for a critical cryptographic product in a systems-oriented development environment.
- / Contributed to software architecture and module design with a focus on reliability, maintainability, and robustness.
- / Developed and executed unit and compliance tests across Linux and RTOS platforms.
- / Participated in debugging, validation, and continuous integration activities in an Agile environment.

Software Developer

Feb. 2025 – Jun. 2025

LIS Data Solutions

- / Built AI-driven solutions using Azure OpenAI and generative AI prototypes with Microsoft Copilot Studio.
- / Designed ETL pipelines and optimized SQL queries for scalable data workflows.
- / Collaborated on data architecture projects involving Databricks, Data Factory, and Delta Lake.

Angular / Node.js Developer

Jul. 2024 – Oct. 2024

Evenbytes

- / Developed and maintained web application features using Angular and Node.js in a production environment.
- / Contributed to implementation, testing, maintenance, and iterative improvement across the software lifecycle.

Education

B.Sc. in Physics

2020 – 2025

Focused on applied physics, computational simulation, advanced data analysis, and mathematical modelling.

Bachelor's Thesis: Developed a custom convolutional neural network using PyTorch and Python to optimize the design of chiral metamaterials. The project focused on extracting genuine physical knowledge from the network's results, bridging the gap between pure science and practical engineering.
